

BACCARAT SYSTEM

The system is based upon exploiting the patterns that appear in most every shoe. Well, all shoes exhibit patterns, but a shoe must sustain a pattern long enough for the player to get on it in order to capitalize. It is easy to look back at a shoe after it is complete and see all kinds of patterns and tendencies, but it is difficult when you are in the middle of playing a shoe to know if a pattern is developing and how to play it. This system will have you on a pattern often before it fully manifest. And if the shoe turns out to be totally random, in the professional version we have a way to deal with that also. But it all ultimately breaks down to this. There are really only two things that can happen when looking at baccarat patterns. It can either go straight (streak) by having 2 or more Player or Bank decisions in a row, or it can zig zag by alternating between Player and Bank. There is really nothing else that can happen, that is if you ignore the effects of ties, which this system does. So, if we can somehow play the streaks and zig zags effectively we have come very close to covering the bases. Therefore we are going to essentially use 3 different score cards at once to track all aspects of the shoe. Now don't get excited, it is a lot easier than it sounds. In fact, after 20 or 30 shoes practice, maybe less, you'll be able to play this in your sleep.

Progression

First I want to discuss the progression we are going to use to track the patterns. Don't get excited when I say progression because this really is a flat bet system. The progression is only used to assist us in ascertaining which side to bet on, Player or Bank. It will kind of act as an indicator of the strongest pattern operating either on the surface or just below the surface at any point in the shoe. The progression goes in series of 3. The first series is 1-2-3, the second is 4-5-6, the third is 7-8-9, then 10-11-12 etc. Each time there is a win in one of the columns we are tracking, the next bet will be the next bet in the series. If you complete a whole series of 3 wins, then you go to the next series. However, if at any point during a series a column loses a bet, it goes back to the beginning of the series. For example, if a column wins 2 in a row, then it has won the 1 and 2 bets and will be ready to make a 3 unit bet. However, if it loses the 3-unit bet, it goes back to the 1 unit bet. If a column has won 4 decisions in a row and then loses the 5 unit bet, the next bet will be the 4 unit bet because it was the first bet in that series. When a column loses 2 decisions in a row, it always reverts to the first bet in the first series, which is a 1-unit bet.

So, to clarify further, in the progression, each series is viewed and played independently. If the first bet is won, then a 2-unit bet is made. If the 2-unit bet is

lost, you go back to a 1 unit bet. If the 1 and 2 unit bets are won, you go to a 3-unit bet. If that bet is lost, then you go back to the beginning of that series and make a 1 unit bet. If 3 bets in a row are won, then a 4-unit bet is made and you are into the second series. From this point on, until 3 bets are won in a row (the 4, 5, and 6 unit bets) every loss will send you back to the 4 unit bet. And 2 consecutive losses will send you back to the first bet in the first series, which is 1 unit, and the whole progression begins again. So, if you win the 4 and 5 unit bet and lose the 6 unit bet, you go back to a bet of 4 units which is the first bet in that series of 4-5-6. Once you win 3 bets in a row and clear the 2nd series, you then progress to the 3rd series of 7-8-9 and follow the same pattern. If you win the 7-unit bet but lose the ensuing 8-unit bet, you go back and bet 7 units once again. Should you lose the 7 unit bet also, you go back to the beginning and make a 1 unit bet. All clear? Hope so.
